

GroupMind

GroupMind is a multi-user, large display application that connects participants' laptops (local and remote) to foster brainstorming and collaboration. As a collaborative activity, GroupMind strives to give groups seamless and real-time communication. Our current exploration uses mindmaps (also called concept maps) as the underlying mechanism for brainstorming. The participants will have synchronous access to a shared, large display workspace, as well as access to their personal laptops. Collaboration can be done at both the large display level and the personal laptop level.
